

Customer Inquiry Intake & Escalation

Takes a customer inquiry from a form, filters out duplicates, routes it by priority, and automatically escalates it if nobody has resolved it within the wait window.

TRIGGER	LOG	ALERTS	STATUS
Form submission	Google Sheets	Slack	Inactive (draft)

What it does

A customer fills out an intake form (name, email, message, company size). The workflow checks whether that email has already submitted an inquiry, logs new inquiries to a tracking sheet with a priority label, notifies the team, and — if the inquiry is still open after the wait period — sends an escalation alert so it doesn't quietly fall through the cracks.

Priority & escalation logic

Email already present in the tracking sheet	Marked duplicate — Slack notice only, no new row logged
Company Size > 500, OR message contains "urgent"	Priority: High
Otherwise	Priority: Normal
Still unresolved after the wait period	Escalation Alert sent to Slack

Workflow steps

- 1 Customer Inquiry Form**
Form Trigger collecting Name, Email, Message, and Company Size from the customer.
- 2 Normalize Input**
Maps the raw form fields into a consistent shape and stamps a `submittedAt` timestamp.
- 3 Lookup Email in Sheet**
Reads the tracking sheet to check the submitted email against inquiries already on file.

- 4 Evaluate Duplicate**
Compares the new email against every row returned by the lookup and flags the inquiry as a duplicate or not.
- 5 Is Duplicate?**
Branches the workflow: duplicates go straight to a Slack notice; new inquiries continue to priority routing.
- 6 Notify Duplicate (Slack)**
Posts a message noting the duplicate inquiry and that no new row was created.
- 7 Check Priority**
Evaluates company size and message content to decide High vs. Normal priority.
- 8 Set Priority High / Set Priority Normal**
Tags the inquiry with its priority level and an initial Status of “Open.”
- 9 Append to Google Sheet**
Logs the inquiry — name, email, message, company size, priority, status — as a new row.
- 10 Send Confirmation Email**
Emails the customer to confirm their inquiry was received.
- 11 Notify Internal Slack**
Posts the new inquiry to the internal Slack channel for the team to pick up.
- 12 Wait 2 Seconds**
Pause step before checking resolution. A workflow note flags this as a stand-in for a 2-business-day wait, meant to be replaced with a Cron-based weekday check for strict business-day logic.
- 13 Check Resolution Status / Still Unresolved?**
Re-checks the inquiry's status after the wait and branches on whether it's still open.
- 14 Escalation Alert (Slack) / No Escalation Needed**
Sends an escalation notice if the inquiry is still unresolved, or does nothing if it's already been handled.
- 15 Error Trigger → Send Error Alert (Slack)**
Runs independently of the main flow: if any part of the workflow errors out, it posts the workflow name and error message to Slack.

Notes

The workflow is currently inactive. The 2-second wait is explicitly a placeholder for a longer business-day wait — worth revisiting before this runs against real customer inquiries, along with confirming the duplicate check scales fine as the tracking sheet grows (it currently pulls and scans every existing row on each submission).
